REC_Python_Week 6_CY

Attempt : 1
Total Mark : 40
Marks Obtained : 36.5

Section 1 : Coding

1. Problem Statement

A shopkeeper is recording the daily sales of an item for N days, where the price of the item remains the same for all days. Write a program to calculate the total sales for each day and save them in a file named sales.txt that can store the data for a maximum of 30 days. Then, read the file and display the total earnings for each day.

Note: Total Earnings for each day = Number of Items sold in that day × Price of the item.

Input Format

The first line of input consists of an integer N, representing the number of days.

The second line of input consists of N space-separated integers representing the

number of items sold each day.

The third line of input consists of an integer M, representing the price of the item that is common for all N days.

Output Format

If the number of days entered exceeds 30 (N > 30), the output prints "Exceeding limit!" and terminates.

Otherwise, the code reads the contents of the file and displays the total earnings for each day on separate lines.

Contents of the file: The total earnings for N days, with each day's earnings appearing on a separate line.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 4
5 10 5 0
20
Output: 100
200
100
0

Answer

```
# You are using Python
d=int(input())
lst=list(map(int,input().split()))
n=int(input())
if d>30:
   print("Exceeding limit!")
else:
   for i in lst:
      print(i*n)
```

Status : Correct ***Marks : 10/10***

2. Problem Statement

Alex is creating an account and needs to set up a password. The program prompts Alex to enter their name, mobile number, chosen username, and desired password. Password validation criteria include:

Length between 10 and 20 characters.At least one digit.At least one special character from !@#$%^&* set. Display "Valid Password" if criteria are met; otherwise, raise an exception with an appropriate error message.

Input Format

The first line of the input consists of the name as a string.

The second line of the input consists of the mobile number as a string.

The third line of the input consists of the username as a string.

The fourth line of the input consists of the password as a string.

Output Format

If the password is valid (meets all the criteria), it will print "Valid Password"

If the password is weak (fails any one or more criteria), it will print an error message accordingly.

Refer to the sample outputs for the formatting specifications.

Sample Test Case

Input: John
9874563210
john
john1#nhoj
Output: Valid Password

Answer

```
name = input()
mobile = input()
username = input()
password = input()

special_chars = "!@#$%^&*"

try:
    if not any(char.isdigit() for char in password):
        raise Exception("Should contain at least one digit")
    if not any(char in special_chars for char in password):
        raise Exception("It should contain at least one special character")
    if len(password) < 10 or len(password) > 20:
        raise Exception("Should be a minimum of 10 characters and a maximum of
20 characters")
    print("Valid Password")
except Exception as e:
    print(e)
```

Status : Partially correct ***Marks : 6.5/10***

3. Problem Statement

Write a program to read the Register Number and Mobile Number of a student. Create user-defined exception and handle the following:

If the Register Number does not contain exactly 9 characters in the specified format(2 numbers followed by 3 characters followed by 4 numbers) or if the Mobile Number does not contain exactly 10 characters, throw an IllegalArgumentException. If the Mobile Number contains any character other than a digit, raise a NumberFormatException.If the Register Number contains any character other than digits and alphabets, throw a NoSuchElementException.If they are valid, print the message ‘valid’ or else print an Invalid message.

Input Format

The first line of the input consists of a string representing the Register number.

The second line of the input consists of a string representing the Mobile number.

Output Format

The output should display any one of the following messages:

If both numbers are valid, print "Valid".

If an exception is raised, print "Invalid with exception message: ", followed by the specific exception message.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 19ABC1001
9949596920

Output: Valid

Answer

```
# You are using Python
class IllegalArgumentException(Exception):
    pass

class NumberFormatException(Exception):
    pass

class NoSuchElementException(Exception):
    pass

register_number = input().strip()
mobile_number = input().strip()

try:
    if len(register_number) != 9:
        raise IllegalArgumentException("Register Number should have exactly 9 characters.")
    if len(mobile_number) != 10:
        raise IllegalArgumentException("Mobile Number should have exactly 10 characters.")
    if not mobile_number.isdigit():
```

```
        raise NumberFormatException("Mobile Number should only contain digits.")
    if not register_number.isalnum():
        raise NoSuchElementException("Register Number should only contain digits
and alphabets.")
    if not (register_number[:2].isdigit() and
            register_number[2:5].isalpha() and
            register_number[5:].isdigit()):
        raise IllegalArgumentException("Register Number should have the format: 2
numbers, 3 characters, and 4 numbers.")
    print("Valid")
except (IllegalArgumentException, NumberFormatException,
NoSuchElementException) as e:
    print("Invalid with exception message:", e)
```

Status : Correct **Marks : 10/10**

4. Problem Statement

Write a program to obtain the start time and end time for the stage event show. If the user enters a different format other than specified, an exception occurs and the program is interrupted. To avoid that, handle the exception and prompt the user to enter the right format as specified.

Start time and end time should be in the format 'YYYY-MM-DD HH:MM:SS'If the input is in the above format, print the start time and end time.If the input does not follow the above format, print "Event time is not in the format "

Input Format

The first line of input consists of the start time of the event.

The second line of the input consists of the end time of the event.

Output Format

If the input is in the given format, print the start time and end time.

If the input does not follow the given format, print "Event time is not in the format".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 2022-01-12 06:10:00
2022-02-12 10:10:12

Output: 2022-01-12 06:10:00
2022-02-12 10:10:12

Answer

```
# You are using Python
from datetime import datetime

start_time = input().strip()
end_time = input().strip()

try:
    datetime.strptime(start_time, '%Y-%m-%d %H:%M:%S')
    datetime.strptime(end_time, '%Y-%m-%d %H:%M:%S')
    print(start_time)
    print(end_time)
except ValueError:
    print("Event time is not in the format")
```

Status : Correct ***Marks : 10/10***
