REC_Python_Week 2_CY

Attempt : 1
Total Mark : 40
Marks Obtained : 40

Section 1 : Coding

1. Problem Statement

Students are allowed to work on our computer center machines only after entering the correct secret code. If the code is correct, the message "Logged In" is displayed. They are not allowed to log in to the machine until they enter the correct secret code.

Write a program to allow the student to work only if he/she enters the correct secret code.

Note: Here, secret code means the last three digits should be divisible by the first digit of the number.

Input Format

The input consists of an integer n, which represents the secret code.

Output Format

The output displays either "Logged In" or "Incorrect code" based on the given condition.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 2345

Output: Incorrect code

Answer

```
a=int(input())
s1=a%1000
s2=str(a)
if s1%int(s2[0])==0:
    print("Logged In")
else:
    print("Incorrect code")
```

Status : Correct

Marks : 10/10

2. Problem Statement

Max is fascinated by prime numbers and the Fibonacci sequence. He wants to combine these two interests by creating a program that outputs the first n prime numbers within the Fibonacci sequence.

Your task is to help Max by writing a program that prints the first n prime numbers in the Fibonacci sequence using a while loop along with the break statement to achieve the desired functionality.

Input Format

The input consists of an integer n, representing the number of prime Fibonacci numbers to generate.

Output Format

The output displays space-separated first n prime numbers found in the Fibonacci sequence.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 5

Output: 2 3 5 13 89

Answer

```
import math
def is_prime(n):
    if n<2:
        return False
    for i in range(2,int(math.sqrt(n))+1):
        if n % i==0:
            return False
    return True
n=int(input())
a,b=0,1
count=0
while count < n:
    a,b=b,a+b
    if is_prime(a):
        print(a,end=' ')
        count+=1
```

Status : Correct

Marks : 10/10

3. Problem Statement

Nisha is a mathematics enthusiast, eager to explore the realm of twin prime numbers. The objective is to develop a program that enables the discovery and presentation of twin prime pairs.

The program should take an integer 'n' as input and generate 'n' pairs of twin primes, displaying the pairs with a difference of 2 between them.

Input Format

The input consists of a single integer, n.

Output Format

The output displays the 'n' pairs of twin primes, the pairs with a difference of 2 between them.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 5

Output: 3 5

5 7

11 13

17 19

29 31

Answer

```
import math
def is_prime(n):
    if n<2:
        return False
    for i in range(2,int(math.sqrt(n)) + 1):
        if n % i==0:
            return False
    return True
n=int(input())
num=3
count=0
while count < n:
    if is_prime(num) and is_prime(num + 2):
        print(num,num + 2)
        count+=1
    num+=1
```

Status : Correct

Marks : 10/10

4. Problem Statement

Taylor is tasked with a mathematical challenge that requires finding the smallest positive number divisible by all integers from 1 to n.

Help Taylor to determine the smallest positive number that is divisible by all integers from 1 to n. Make sure to employ the break statement to ensure efficiency in the program.

Input Format

The input consists of a single integer, n.

Output Format

The output displays the smallest positive number that is divisible by all integers from 1 to n.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 10

Output: 2520

Answer

```
import math
n=int(input())
lcm=1
for i in range(1,n+1):
    lcm=lcm*i // math.gcd(lcm,i)
print(lcm)
```

Status : Correct

Marks : 10/10
